

- Trace (ppm) to % level Oxygen measurement in gas & liquid applications
- Measurement accuracy, drift and lifetime not affected by presence of H₂S, CO₂, SO₂ and H₂
- Auto-Calibration & Remote Validation
 - Timer-based or user initiated (HMI or RS485)
 - Test Gas Insert (HMI or RS485)
- Rugged Field Enclosure - Local Display & HMI
 - IP66 & NEMA 4X
 - Through-the-glass keypad (no tools or permits required)
- Pressure Compensated Measurement
 - Ambient (on-board) pressure sensor
 - 4-20 mA active (loop powered input) for optional in-line pressure transmitter
- Works with BOSx FlexSense I, FlexSense II and SafeTap fiber optic oxygen sensors
 - Replaceable sensor caps (simple and cost effective)
- OXYvisor PC software for configuration, set-up, diagnostics and trending
- Hazardous Area Approvals
 - IEC Ex, ATEX, NA - Zone 1 & Zone 2 IIC
 - cULus (NRTL) - Class I, Div 2, Groups A, B, C, D T4

The OXYvisor optical oxygen Analyzer is Barben Analytical's next generation solution for oxygen measurement in industrial applications. When paired with the BOSx optical oxygen sensor's quenched luminescent technology, the OXYvisor provides the ability to measure oxygen in liquid and gas phase processes.

For more information on Barben Analytical's BOSx Oxygen Sensors and our sample conditioning panel products please refer to the separate data sheets for these products:

Barben Optical Sensor (BOSx) - Data Sheet

Sample Calibration Panel - Data Sheet

Typical Applications - Gas Phase (g)

- O₂ in hydrocarbon streams
 - Vapor recovery units (VRU's)
 - Gathering lines/headers
 - Gas plant inlets
 - Booster / compressor stations
 - Custody transfer points
 - Transmission and distribution
- Trace O₂ detection in nitrogen headers
- Biogas oxygen detection (moisture and H₂S)
- Pure ethylene and propylene production
- O₂ in nitrogen tank blanketing
- Trace to % level oxygen in syngas gas
- Annealing furnaces (H₂ and inert gases)

Note: Limit of Detection: 0.5 ppm O₂ @ 1atm, 20°C (0.0005 hPa)

Typical Applications - Liquid Phase (l)

- ppb dissolved O₂ for water-flood injection
- Produced water dissolved O₂
- Oxygen in methanol and ethanol
- Oxygen in oil separation
- O₂ in aqueous and non-aqueous solutions

Note: Limit of Detection: 1 ppb Dissolved O₂

Precision Optical Oxygen Measurement

OXYvisor® Oxygen Analyzer

Principle of Operation

The OXYvisor analyzer uses an optical quench luminescence technology to measure process oxygen. Phase modulation of the luminescent decay time of an oxygen specific luminophore allows the calculation of the partial pressure of oxygen concentration within the process stream.

The analyzer uses an LED to emit blue light through fiber optic cable down to the luminophore at the sensor tip [Fig 1]. The luminophore absorbs the energy and rises to an excited state indicated by red light returned back through the fiber optic cable. The properties of the emitted light are measured through a photomultiplier tube back at the spectrometer within the analyzer.

In the absence of oxygen, the excited luminophore will fall back to its ground state at a specific intensity and phase angle. When oxygen is present it quenches the fluorescence at a lower rate proportional to the oxygen concentration [Fig 2.]. The phase shift and intensity differences between the excitation source and the fluorescent signal is measured and the oxygen concentration is calculated [Fig 3].

The resulting measurement is specific to oxygen concentration. The luminophore is unaffected by other contaminant gases and flow rate. The measurement is applicable in both gas and liquid phase. Temperature compensation is required to account for quenching efficiency at different temperatures and pressure compensation is required to measure the process pressure when different than the pressure at time of calibration.

Light transmission through fiber optic to luminophore

Figure 1

Effects of 100 ppm oxygen quenching

The affect of oxygen quenching on light intensity from the luminophore sensor is shown above. Light emitted from the excited luminophore has higher intensity over a longer time period than when oxygen is present. The intensity and time are measured by the spectrometer within the OXYvisor to provide an oxygen measurement.

Figure 2

AC modulation and the phase shifted output

AC modulation of the blue light results in a similar waveform of the emitted red light from the luminophore sensor. The presence of oxygen causes a phase shift between ϕ_1 and ϕ_2 of the red light waveform. Measurement of this phase shift proportionally matches the loss of intensity shown in figure 2 above. The combination of both measurement techniques provides a stable, accurate method to measure oxygen in liquid and gas phase applications.

OXYvisor Analyzer Features (Hardware/Firmware/Software)

HMI Touch Keys (thru-the-glass): Easy to use configuration and calibration menus can be accessed through a touch screen, infrared keypad, protected behind the analyzer window.

HMI LockOut Screen: HMI lockout screen prevents any unwanted HMI interaction with critters, debris, or maintenance technicians.

Sensor Connection Junction Box: Connection of the BOSx Optical Sensor is easily made through the junction box. In the rare case it is ever needed, this design allows for easy fiber optic sensor replacement, in the field, without exposing the electronics to dust, humidity or human error. Normally the fiber optic cable is installed once and the sensor cap is the standard replacement item.

Data-Logging (USB Port): A USB port within the rear compartment, can be used for downloading logs of measurement data, and diagnostic information. Historical time based Oxygen, phase angle, intensity, temperature and pressure measurement, along with error logs and calibration history is stored in .csv format and available for download via USB memory stick.

Programmable I / O: The OXYvisor comes with two analog outputs, four isolated digital relay outputs and, one analog input. All I / O's are fully user configurable (variable and range) through the keypad, software or RS485 Modbus. Additionally, an (active) digital input can be used to connect a customer supplied toggle switch or other external contact, to initiate AutoCal or test gas insert (REMOTE VALIDATION).

MODBUS RTU: All OXYvisor units have a standard MODBUS RS485 serial output. This 2-wire signal can be used to transmit measurement values, initiate automatic calibration of the device or software configuration of the analyzer.

Calibration Options: Several calibration options are available to best suit the customers installation and application requirements.

- **Factory Cal** provides quick startup without test gas. The calibration values found on the sensor certification sheet can be uploaded and good results can be expected. (We recommend to field validation for best results.)
- **Manual One-point** calibration with either zero or span gas, depending on the customer requirements.
- **Manual Two-point** calibration using zero and span gas (recommended for new users).
- **Auto-calibration (AutoCal)** logic in the OXYvisor firmware along with three on-board digital relays (passive) allows for complete AutoCal and validation with known test gases. The AutoCal logic allows user programming of time based calibration, gas selection and the hysteresis criteria for pass / fail evaluation.
Auto-calibration requires: AutoCal SCP Panel or three user provided, powered, solenoids & test gases

On-Board Diagnostic Memory: The last ten calibrations as well as the last ten error messages are stored within the analyzer at all times and can be viewed through the firmware at the HMI or via PC software.

Security: If operator access control is required then each sub-menu can be locked out using a four digit security pass-code. These codes can be entered through the keypad or via the OXYvisor software.

BOSx - Barben Oxygen Sensors (BOS1, BOS2 & BOS3)

Barben Oxygen Sensors (BOSx) are available separately or as part of an integrated Sample Conditioning Package (SCP) with the OXYvisor. BOSx sensors consist of a fiber optic cable with an SMA connector and an oxygen-sensing luminophore. Three sensor ranges are available—BOS1, BOS2, and BOS3—and the selected sensor determines the OXYvisor's measurement range, accuracy, and repeatability. For additional information, refer to the BOSx Sensor Product Data Sheet.

BOS1 Sensor Specifications - Liquid Phase / Gas Phase

BOS3 Sensor Specifications - Gas Phase Only	
	Gaseous O ₂ @ 1 atm, 20 °C
Measurement Range	0 - 300 ppm (over-range of 1000 ppm)
Limit of Detection (LOD)	0.5 ppm
Resolution @ 20 °C and 1013 hPa	± 0.5 at 10 ppm; ± 0.8 at 100 ppm; ± 1.5 at 200 ppm
Response Time (T ₉₀)	< 3 sec. based on 0 - 300 ppm measurement range
Accuracy @ 20 °C	± 2 ppm or ± 5% of measured value; whichever is greater (± 0.002 hPa)
Drift from Photo-decomposition	< 1.5 ppm within 30 days (60 sec. sample interval)
Operating Temperature Range	0 to 50 °C (32 to 122 °F) continuous
Allowable Sensor Temperature	90 °C (194 °F) non-continuous

Cross Sensitivity for BOS1, BOS2, BOS3 Sensors Listed above

No cross-sensitivity for carbon dioxide (CO₂), hydrogen sulfide (H₂S), ammonia (NH₃), gaseous sulfur dioxide (SO₂), no cross-sensitivity to pH (1-14), ionic species like sulfide, sulfate or chloride. Usable in methanol, ethanol-water mixtures, and in pure methanol & ethanol. Avoid organic solvents like benzene, chloroform, toluene, acetone, and methylene chloride along with any strong oxidizers such as gaseous chlorine (Cl₂)

BOS SAFETAP Retractable Optical Oxygen Sensor Specifications	
Valve Options	316 stainless steel ball valve W.O.G., Optional 29" Hg full vacuum NACE MR0175 certified ball valve
Operating Pressure Rating	Up to 750 psig (51.7 barg)
Insertion / Retraction Pressure Rating	Up to 450 psig (31.0 barg) Note: physical insertion / retraction may become more difficult over 300 psig
Temperature Rating	0 to 50 °C (32 to 122 °F) operating, 90 °C (194 °F) non-continuous
Internal Seal Options	Viton, EPDM, FFKM (Kalrez)

Quick configuration, troubleshooting, trending and datalogging of the analyzer measurements can be easily accomplished through the OXYvisor Software. The software utilizes the MODBUS RTU protocol to communicate with the analyzer.

Oxygen measurements, temperature, pressure and sensor characteristics such as phase angle and amplitude can be captured on the screen simultaneously or via a .csv file on the host computer.
